

Web App for a Financial Service Provider

Overview

A leading financial service provider offers a flexible suite of easy-to-use, cloud-based solutions to help global investors and their consultants select investment managers, enable asset managers to successfully market their funds worldwide and assist clients to identify and capitalize on global investment trends. They are in need to develop a web application which can be accessed on any device (computers, tablets and mobile) to be accessed by several users. Nexgile has proposed to develop a web application utilizing Outsystems for a faster output.

Challenge

The independent brokers and their customers expected an online access as they have to go through the customer care for basic details and it is also increasing the costs for company. Providing an exclusive portal quickly without increasing the costs and project timelines has been a challenge for the company.

Solution

Nexgile has analysed the business case of the company and identified the key areas in the existing system to integrate the information with the new interface which will be provided to the brokers and their clients. Considering the timeline constraints, we have suggested to utilize the Outsystems for faster output with low-code development.

- Developed MVC based web application which helps to scale the application to any level
- Integrated with in-house systems which are based on .NET
- Enabled SSO (Single Sign-On)
- Implemented accessibility standards
- Implemented responsive User Interface to make this application accessible from any device

Key Benefits

- Reduced support costs and increased business
- Better user experience through simplified web interface
- Real-time status tracking of investments and requests
- Integration of in-house systems enabled to utilize the data very efficiently
